

Abstract

5. An apparatus (10) for cutting a material (16), in particular a fabric or the like, which is fed in the form of a continuous strip, from a respective reel (14), and cut into appropriate portions. The apparatus comprises a support frame (12), means (22) to support the material in the form of a work plane (22), on which the material is spread. Above the work plane (22) are one or more mobile cutting units (18), each with a material cutting blade
10 (20). The work plane (22) supporting the material (16) is made from glass and is equipped with appropriate means to make the work plane elastically yielding in such a way as to perform the cutting of the material without the risk of the cutting blade damaging the work plane. (FIG. 5)
